

# The Passive Design REVOLUTION

Passive design is architectural design that eliminates the need for mechanical heating and cooling of a building through the use of smart heating and cooling strategies. More than building orientation and insulation, indoor climate control in passive houses can be up to 90% self-sustaining.

"If we had to pick one thing that was going to give us the best return on our efforts to reduce energy demand locally and globally, it lies in the revolution of building codes to passive design." *Dr. Jack Gosnell*

WHEN: May 27, 2009 • 7 pm

WHERE: Chaparral Auditorium  
414 E. Ojai Avenue
